

Botanical Name: Euonymus japonicus 'Chollipo'

Common Name: White-edged euonymus

Type of Plant: dicot; shrub Character evergreen

Habit of Growth:

Overall Shape upright, rather dense, with a stiffly branched, rounded to oval form; medium textured woody shrub

Height 3-6' (10') Spread 2-4' Growth Rate moderate

Environment:

Exposure outdoors full sun

Soil well drained soil

Hardiness hardy (zones 5-20)

Morphology:

Leaves pinnate, opposite, oval-ovate, somewhat roundish, 1-2" long, blades green with white edge, somewhat serrate

Flowers tiny, greenish white flowers in terminal clusters

Fruit 1/4" capsule

Propagation: semihardwood cuttings - best results in summer

Usage: filler for variegated foliage, formal or informal hedges, may be pruned into screens, does poorly near coast

Landscape Care:

Watering prefers regular watering, tolerates occasional drought

Fertilizing balanced, as needed in the spring

Pruning head back frequently to maintain dense form; shear cutting is common

Pests/Diseases scale, powdery mildew near coast

Special Conditions shade and poor air circulation contributes to powdery mildew

Origin: Japan Family: Celastraceae
